

Digital Ocean Configure Git & Apache Cheat Sheet

This sheet is to show how to configure Apache and Git for a new droplet.

Use a command line to connect to the droplet. The following commands will install & configure Git on the droplet. Git needs to be installed at the root level of the Droplet. When done, you can start cloning Git repositories to the droplet.

Note: The root in this example uses the name of the Droplet.
Git repos should cloned into ~/**var/www/html/Name-of-repo**
In this example it will be:
root@**NameofDroplet**:/**var/www/html/NameofRepo**

From Terminal:

Connect to the droplet:
ssh root@**ip address**

INSTALL GIT TO THE DROPLET.

root@ApacheDynamicSite:~# sudo apt-get install git

SET GIT ON THIS DROPLET TO USE THIS NAME.

root@ApacheDynamicSite:~# git config --global user.name “**Name**”

SET GIT ON THIS DROPLET TO USE THIS EMAIL.

root@ApacheDynamicSite:~# git config --global user.email “**email**”

CREATE SSH KEY

root@ApacheDynamicSite:~# ssh-keygen -t rsa -b 4096 -C “**email**”

CREATE SPECIFIC ID FOR SSH

root@ApacheDynamicSite:~# eval “\$(ssh-agent -s)”

ADD ID TO THE SSH KEY

root@ApacheDynamicSite:~# ssh-add ~/.ssh/id_rsa

SHOW ME THE PUBLIC SSH KEY. SO I CAN PASTE IT INTO GITHUB.COM

root@ApacheDynamicSite:~# cat ~/.ssh/id_rsa.pub

Go to: Github.com/settings/SSH and GPG keys
Use a title that helps you remember what this key is for.
Paste the key here.

CHANGE TO WEB ROOT DIRECTORY

root@ApacheDynamicSite:~# cd ..
root@ApacheDynamicSite:~# cd /var/www/html

CLONE MY GIT FORK INTO MY DROPLET.

root@**ApacheDynamicSite**:/**var/www/html/wats1030-dynamic-page**#
git clone git@github.com:**GithubUserName/GithubRepo**

CHECK YOUR WORK.

root@ApacheDynamicSite:/var/www/html/wats1030-dynamic-page# ls
THE CLONE IS HERE!
wats1030-dynamic-page

Next, Configure Apache to present the info in this droplet/this directory

This exercise contains sample files. Some of these files are the website we want to present, others are used to tell Apache what to do.

OPEN THE PROVIDED SAMPLE FILE AND MODIFY IT

root@ApacheDynamicSite:/var/www/html/wats1030-dynamic-page# less sample.host.config.conf

MOVE / RENAME THE SAMPLE FILE USE SUB-DOMAIN+DOMAIN, JUST TO MAKE IT EASY TO KNOW WHAT PIECES GO TOGETHER

root@ApacheDynamicSite:/var/www/html/wats1030-dynamic-page# mv sample.host.config.conf
subdomain.domain.com.conf

COPY THE NEW CNFG FILE TO A PLACE APACHE KNOWS ETC/APACHE2/SITES-AVAILABLE

root@ApacheDynamicSite:/var/www/html/wats1030-dynamic-page# cp **subdomain.domain.com.conf** /
etc/apache2/sites-available/.

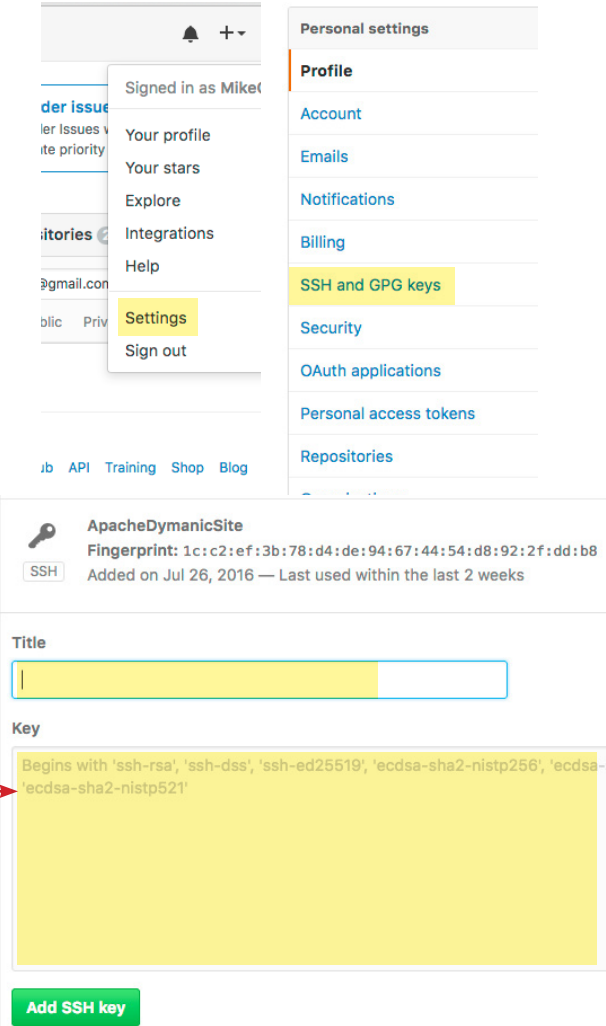

TELL APACHE, THIS IS THE DEFAULT CONFIG TO USE.

root@ApacheDynamicSite:~# sudo a2ensite **subdomain.domain.com.conf**

RE-START APACHE

root@ApacheDynamicSite:~# service apache2 reload

```
root@ApacheDynamicSite:~# cat ~/.ssh/id_rsa.pub
ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQADBGVMV+yk3CeUv/qR+CFeX0yuoDA+6Hz10zUxfhGU0r0
